YOUR ACCESS LINE HAS A STORY, WE'LL TELL IT TO YOU FOR FREE

Powered by Quadrivia

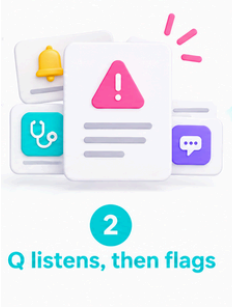

A free, no-integration diagnostic built from your own call recordings. No PHI risk.

Q is agentic AI designed to interact naturally with patients, analyze what they need, and execute their journeys, from access and scheduling through the rest of care. For this diagnostic, Q reviews a de-identified sample of your call recordings and surfaces what's actually happening on the line: what's getting answered, what's getting missed, and what patients are saying that your routing data can't show you.

HOW IT WORKS

Export a sample from your existing phone system. No integration, no live plug-in, no IT lift on your end.

Q listens and flags what needs a clinician's eye: emergent presentations, clinical messages, anything routing data would miss.

A clear picture of what's happening on your lines today, built entirely from your own call data.

WHAT YOU'LL SEE

- The business case: missed appointments, the annual dollar opportunity behind them, ROI multiple
- The call funnel: what's arriving, what's answered, what's going to voicemail, what's getting nothing
- Patient-level reality: how many patients never got through, not just how many calls didn't connect
- Time by service line: where staff hours are actually going

WHAT LISTENING CATCHES THAT LOGS CAN'T

Call logs tell you a call went to voicemail. They don't tell you what the patient said. Q listens to what actually happened on every line: emergent presentations buried in "voicemail," clinical messages that never made it to escalation, calls that need a clinician's eye before they need a callback.

You direct. Q delivers. No commitment required to see the diagnostic through.

Recordings can be de-identified before review, consistent with Q's HIPAA-compliant, SOC 2 Type I environment. No PHI risk.
